exe, decompiled.il and x86, x64 or both files. The Decompiler has a User Interface (GUI) that allows to click the mouse on a function name in order to choose it for analysis, or generate a watch window showing the parameters. Functions are displayed with the type, the name and a preview of the code (if available). The user can choose to expand the code by using the arrow keys, and to browse the code (by jumping to a specific line) by using the TAB key. The disassembler supports graphical XML-based x86, x64, Win32 and ARM assembly files, and works with most of the assembly codes available for download for the different processors. It can decode instruction, macro and data tables. It also supports inline assembly instructions. Output options The decompiler has the following output options. Graphical View This option enables the decompiler to generate a graphical window which displays the different functions in an easy way, and allows to choose them for analysis. Animated View This option provides a more convenient way to see how the different functions appear in the instruction window, by generating the GUI in a continuous loop. Textual View This option allows to see the textual content of the file, in addition to the graphical and animated options. Debug View The debug view option generates a textual representation of the code, for a debugging tool. Binary View The binary view option generates a binary file to load it and have it analyzed by an external binary analysis tool. NOTE: There is a limit on the size of the files that can be decompiled. References Cloud-Based x64 Decompiler for .Net Developers, Decipher Info Security, September 2011 External links Category:Analysis tools Category:Evaluation software Category:DecompilersQ: Use of Canon camera, darkroom, long exposure I'm planning to use a Canon camera, a darkroom and long exposure. It will be shooting a laser reading on the bottle that will get a low value, so it will be in green (0 - 2500K) and in 3 different lighting. The laser has an accuracy of 0.3%. So my values will be from 0.9% to 10%. With these values, will it be possible to get a good result? Or will the result not be accurate? 82157476af
